2015 Menominee County Workforce Profile

National and State Economic Outlook

Robust economic growth after the Great Recession remains anticipated. The recession ended in June of 2009. This recovery has been the slowest of post-war cycles. U.S. gross domestic product (GDP) growth through this recovery cycle has averaged just over two percent per year. Most recoveries show growth rates in the three percent range.

As with all economic growth, benefits have accrued. Job levels are up. Wages have increased. Home values are nearly back to prerecession levels. Wisconsin total non-farm jobs have increased by 200,000 since the trough in February 2010 through October 2015. The state's manufacturing industries have gained almost 50,000 jobs. Total nominal wages paid have increased by 17 percent since bottoming out in 2009. Aggregate household real estate values have all but full recovered from the national housing devaluations that began in 2006.

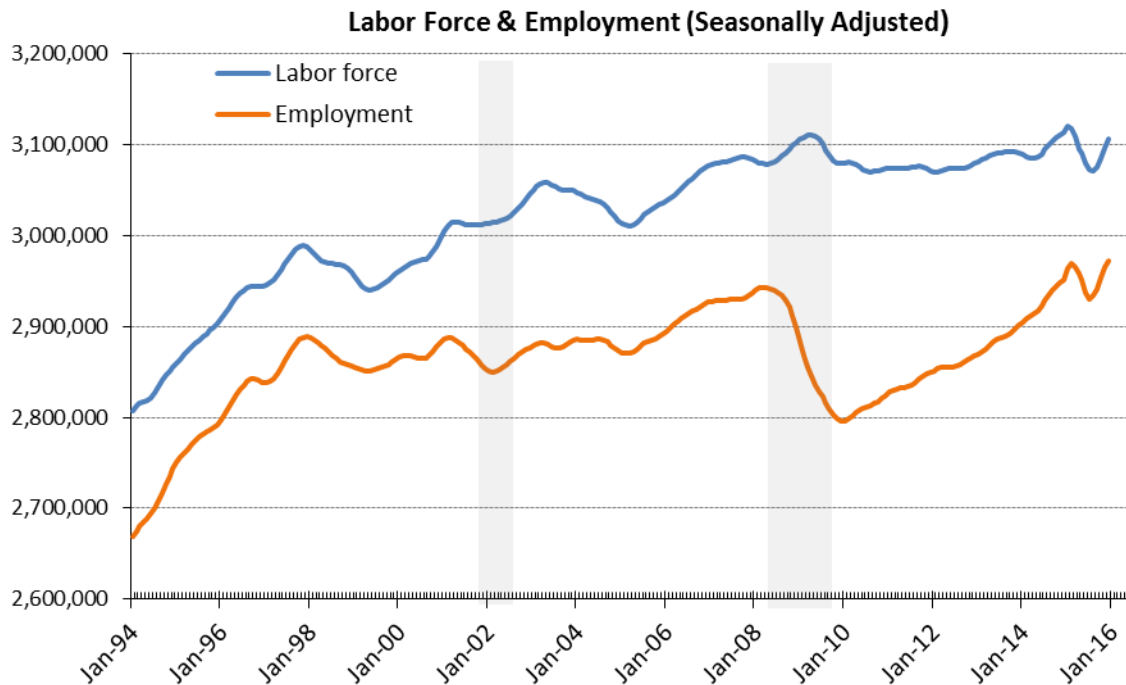

So what is it, six years after the recession ended, that is holding the national economy back from even stronger growth? A variety of factors are having an impact, such as: flat real wages, lack of business investment, focus of business investment, slower global economic growth, a stronger U.S. currency and its impact on U.S. and Wisconsin exports, and snug government capital and operations budgets.

The silver lining may be that the slower the growth, the longer the recovery will last. This recovery is 70 months old as of December 2015 with no expected downturn in sight. The average growth period of post-war business cycles is 58.4 months.

Workforce Outlook

On the workforce front, there is much discussion of the "skills gap" – the inability of employers to find and keep skilled workers. One anecdote often voiced is that Wisconsin companies could expand business if only they could find and retain skilled workers.

Wisconsin has never had more people employed and the unemployment rate is registering low levels not seen since the early 2000s. However, as has been discussed repeatedly over the years (Winters, Strang, & Klus, 2000; Winters, Gehrke, Grosso, & Udalova, 2009; Wisconsin Taxpayer Alliance, 2015), Wisconsin faces a quantity challenge and, as a consequence, a skills challenge.

Source: Local Area Unemployment Statistics, Bureau of Labor Statistics

2015 Menominee County Workforce Profile

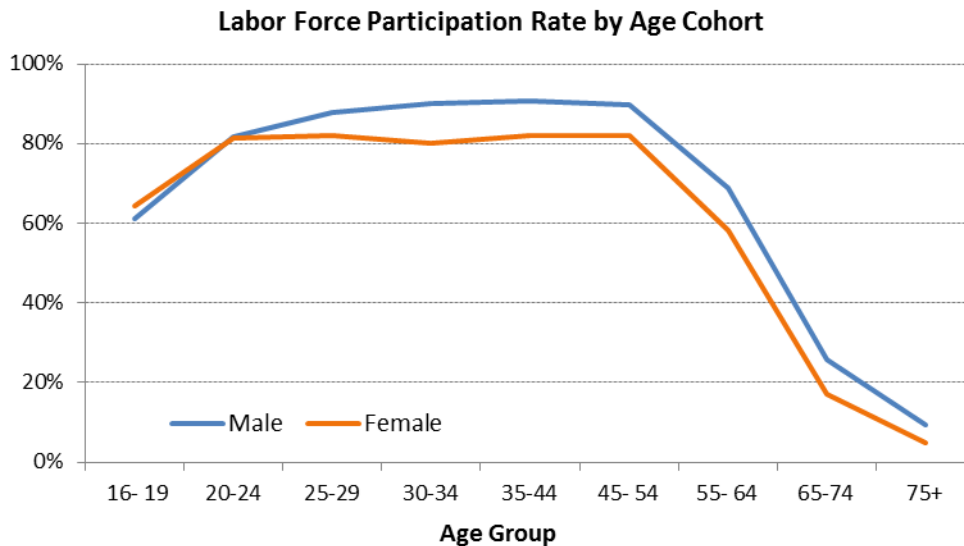

Businesses will be competing not only with each other for workers with similar skills, but also with entities of other disciplines. For example, one company may try to recruit a math teacher to become a computer programmer. Then the school will have to find another math teacher from, say, an insurance company, which, in turn, may try to recruit someone out of health care. The point is that without enough workers to go around, some businesses will end up short of talent.

This is true not only of highly skilled workers, but for all positions. Even retail and restaurant operations are displaying help-wanted signs.

During the late 1990s when the U.S. economic expansion was setting new longevity marks, there was a similar quantity challenge. The national unemployment rate fell to 3.8 percent in July 2000 and Wisconsin's unemployment rate fell to 3.0 percent in July of 1999. Two recessions alleviated the labor quantity constraints from 2001 to 2014. Now the U.S. unemployment rate is down to 5.0 percent (Wisconsin December 2015 seasonally adjusted unemployment rate was 4.3 percent), GDP is only growing at 2.0 percent, and businesses are already experiencing quantity challenges.

The major change in the labor force during this period is that now the Baby Boomers are fifteen years older and leaving the labor force in unprecedented numbers. The oldest Baby Boomers (born in 1946) will be 70 years old in 2016. The youngest (born in 1964) will be 52 years old, a mere three years from a rapid decline in their participation in the labor force.

Below is a graph of the labor force participation rate (LFPR) by age cohort. The LFPR drops precipitously after age 55. The bulk of the Baby Boomers are now over age 55.

Source: Bureau of Labor Statistics

Wisconsin's overall labor force participation rate peaked in the late 1990s and the employment-to-population ratio (e/pop) peaked in 1997 at 72.9 percent. The 2014 e/pop rate was above the 2010 low of 63.4 percent, at 64.7 percent.

The exit of Baby Boomers (people born between 1946 and 1964) from the labor market will affect future growth of Wisconsin's e/pop rate.

Population growth and age distribution will drive labor force availability in local and regional labor sheds. Below are county level demographic and economic characterizations. The primary factor driving economic trends in future years will be workforce developments and talent access.

Population and Demographics

Menominee County's 10 Most Populous Municipalities

	April 2010 Census	January 2015 Estimate	Numeric Change	Proportional Change
United States	308,400,408	320,289,069	11,888,661	3.9%
Wisconsin	5,686,986	5,753,324	66,338	1.2%
Menominee County	4,232	4,244	12	0.3%
Menominee, Town	4,232	4,244	12	0.3%

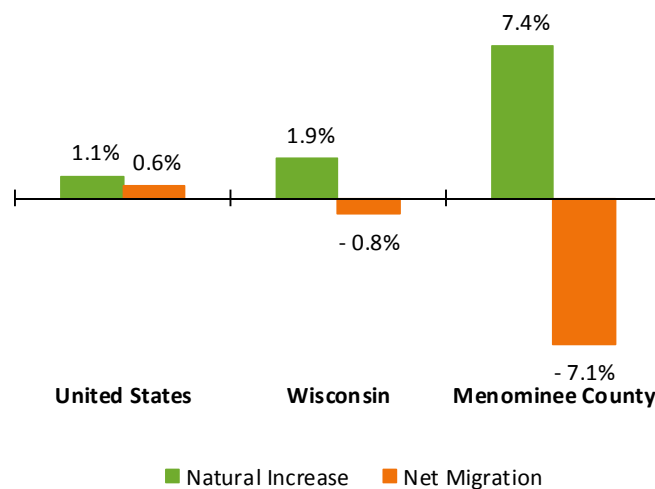

Source: Demographic Services Center, Wisconsin Department of Administration

Menominee County's population growth has slowed significantly over the past several years. The population growth rate remains behind national growth trends, growing by 0.3 percent since the 2010 Census. In comparison the state's population has increased 1.2 percent over the same period, illustrating a series of disparate dynamics that will be discussed throughout the course of this profile. The county gained 12 residents between 2010 and 2015, a sum that is significantly greater than the -7.2 percent contraction that occurred during the previous decade (330 loss from 2000 to 2010). Its 0.3 percent growth rate is also significantly slower than the 17.3 percent growth observed in the 1990's, suggesting that the population growth that has occurred over the past three decades is gradually slowing. This is a common theme among many of the region's more rural counties.

Any discussion of population growth in Menominee County is inherently limited both due to its relative size as well as the fact that the borders of the Town of Menominee are shared with Menominee County. There has been quite a bit of movement between Menominee and Shawano County over the course of the past thirty years as the two counties share a common labor market.

Population growth has been defined by a natural increase rate that is nearly four times higher than the state average. This is associated both with a healthy birth rate in the county and a relatively low median age. Net migration is significantly negative resulting from movement throughout and into the region. This has become more pronounced in response to an aging population throughout Northeast Wisconsin. It is again important to note that significant percentage swings are frequently observed in counties with smaller populations. This will be a recurrent theme throughout this profile.

Components of Population Change

Labor Force Dynamics

A great deal of recent attention has been committed to changes in the Menominee County labor force over the past several years. Many of these conversations have focused on two related metrics — the county’s unemployment rate and the relative ability of the county’s employers to find needed talent. The narrative that has emerged in this dialogue has concluded

that, as the county’s unemployment rate has decreased precipitously since the peak of the 2007-2009 recession, employers have witnessed greater difficulty in finding needed workers. While there is a great deal of credence to this assumption, the cause of these issues is largely demographic.

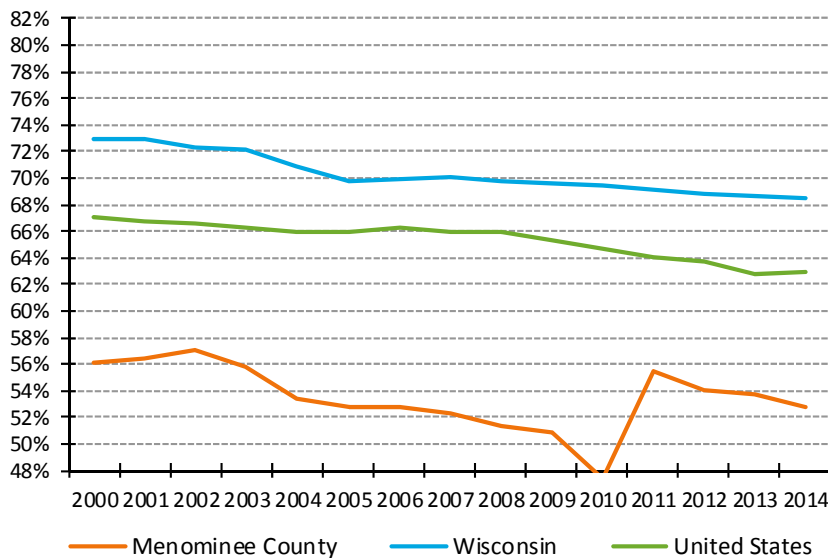

The chart above tracks Menominee County’s unemployment rate against that of both the nation and state from January 1990 to September 2015. It is important to first note that significant seasonality exists in this data, reflecting calendar year changes in demand in industries ranging from construction to hospitality. The county’s

Unemployment Rates - Not Seasonally Adjusted

Labor Force Participation Rates

Source: Current Population Survey, U.S. Department of Commerce, Census Bureau

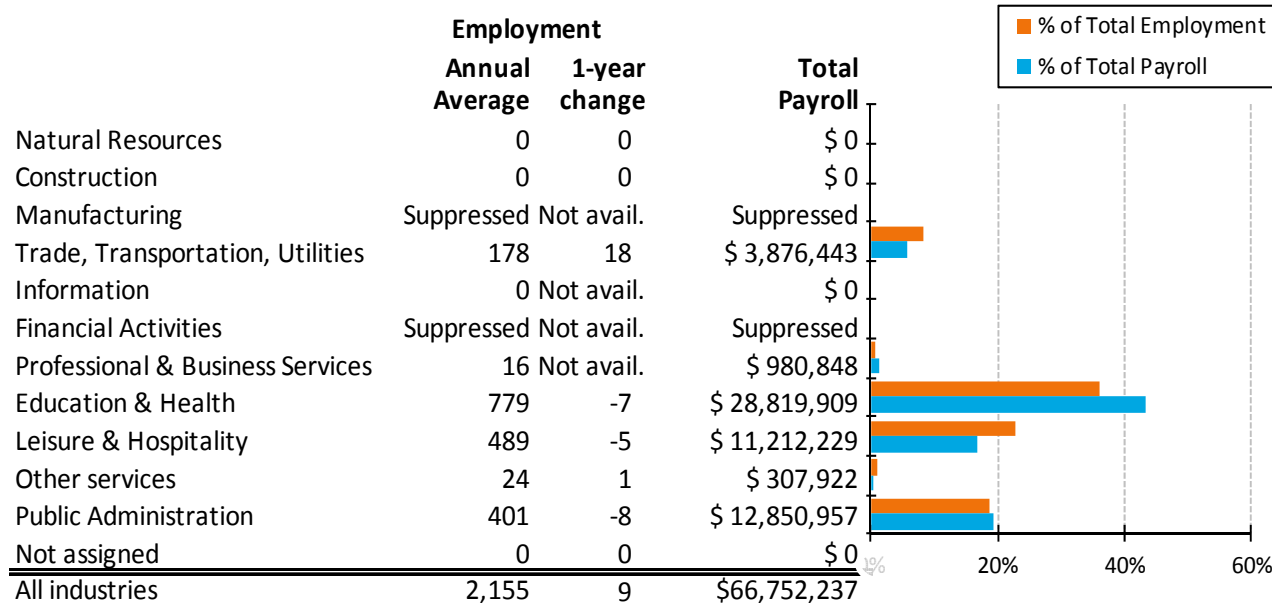

unemployment rate has historically remained significantly higher than either state or national rates due again to a relatively small labor force. The county’s labor force has remained virtually unchanged over this period suggesting that individuals are finding employment more rapidly than new entrants are added.

Menominee County’s labor force participation rate has remained significantly below the state average over the past fifteen years. This closely mirrors changes in local unemployment and is also bolstered by a series of industry em-

Industry Employment and Wages

2014 Employment and Wage Distribution by Industry in Menominee County

Source: WI DWD, DET, BWITS, Quarterly Census Employment and Wages, June 2015

ployment conditions that we will discuss in the coming pages.

The charts included on this page represent 2014 annual averages from the Quarterly Census of Employment and Wages. This program presents employment and wage data for more than 186,000 employers in Wisconsin and represent our most comprehensive look at industry dynamics. All industries employment in Menominee County increased by nine employees, suggesting that a number of key industry sectors have experienced little to no growth with one exception. Data for many of the county's industry sectors is not publicly available due to suppression. The Trade, Transportation, and Utilities sector added 18 new workers, and the Education and Health Services sector experienced a loss of seven positions. Losses were also observed in the Leisure and Hospitality

and Public Administration sectors. The construction industry growth in the county was flat in contrast to significant growth throughout the state as both residential and commercial sectors have recovered to near pre-recessionary levels.

Employers in many of Menominee County's industry sectors continue to pay wages that are below state averages. The county annual average wage of \$30,976 is 29.4 per-

cent below the state average, has increased by one percent in the past year, and has been behind the rate of inflation over the same period. It is difficult to ascertain whether wages have increased over this period among individuals in similar roles or if wages have increased by a more significant degree due to individuals changing roles either within or between organizations.

The largest difference between Menominee County and Wisconsin annual average industry wages can be found in the Leisure and Hospitality industry sector where wages exceed the state average. Gaps in other sectors are accounted for by differences in industry composition, especially in the Leisure and Hospitality and Natural Resources industries. Differences among other industry sectors can be generally accounted for by variations within the industry with a higher share of workers in Menominee County working for a concentration of small regional employers or tribal-owned businesses. The wage disparities seen here are also offset to a large extent by a relatively lower cost of living.

Our focus now shifts to the consideration of potential future employment trends. The data presented on the next two pages has been produced as part of the Department's two-year long-range employment projections cycle. The current ten-year forecast examines employment over the period between 2012 and 2022 and has been published at both the state and Workforce Development Area level. The industry and occupational employment projections are presented for the eleven-county Bay Area Workforce Development Area. This region includes more than just the area directly impacted by the Menominee County regional economy. Industry employment in Menominee County only accounts for 0.1 percent of employment in the region. However, employment and economic dynamics are similar enough within all parts of the region to comment on general trends.

Employment across all industries is expected to grow by eight percent over the ten-year period, or almost 25,000 workers. This projection only forecasts levels of filled positions rather than potential demand. This further supports the earlier assertion that the availability of labor throughout the region may be actively constraining employment growth. As the region's population continues to age and growth slows this will continue.

Source: Office of Economic Advisors, Wisconsin Department of Workforce Development, September 2015

The most significant numerical growth is expected in the Education and Health Services (8,207) and Professional and Business Services (4,582) industry sectors. This is equal to 13 and 17 percent period growth, a rate only eclipsed by anticipated growth in the Construction sector (19 percent).

Growth in a number of other industry sectors are significant with a pair of notable outliers. Public sector and trade, transportation and utilities employment is expected to be constrained over the next decade as the workforce in this sector continues to age more rapidly than the population as a whole. Manufacturing employment is also expected to grow more modestly at three percent, slightly exceeding anticipated statewide sector growth of two percent.

An examination of projected occupational employment growth reveals a possible explanation for the moderate growth rates anticipated in a number of the region’s largest industry sectors. We first see that the most significant occupational growth can be observed in a number of occupational categories largely concentrated in the Health Services sector, including Healthcare Practitioners, Healthcare Support, and Personal Care and Services workers. Significant growth is also anticipated in many other occupational sectors, supporting the narrative of long-range stability in many of the region’s largest industries. The other trend that is also illustrated is that of

Personal Income

	2004 Nominal Per Capita Personal Income	2004 Per Capita Personal Income in 2014 dollars	2014 Per Capita Personal Income	Nominal Change in Per Capita Personal Income (2004 - 2014)	Inflation-adjusted Change in Per Capita Personal Income (2004 - 2014)
United States	\$34,316	\$41,709	\$46,049	34.2%	10.4%
Wisconsin	\$33,350	\$40,534	\$44,186	32.5%	9.0%
Menominee County	\$19,423	\$23,607	\$25,919	33.4%	9.8%

Source: Bureau of Economic Analysis

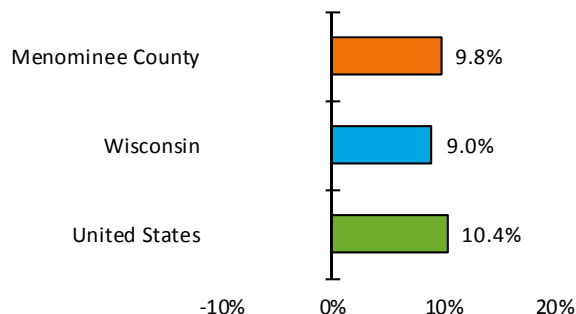

labor constraints as openings created due to replacement needs outnumber those generated by new growth.

The final topic to be considered in this profile is that of personal income. It is again important to note that personal income differs from wage income in that wage income is one component of personal income, but personal income also includes secondary income sources such as rental and dividend income and transfer payments. Menominee County's per capita personal income in 2014 was \$25,919 or \$18,267 lower than the state average. This places Menominee County at the bottom of Wisconsin's 72 counties ranked by income. This measure also

2014 Per Capita Personal Income

2004 - 2014 Change in Per Capita Personal Income, Inflation-adjusted

Source: Bureau of Economic Analysis

is below the national average of \$46,049 by 43.8 percent, remaining far to the national average over the past decade as both nominal and inflation-adjusted per capita personal income growth in Menominee County lagged behind national averages. This is largely due to the growth of non-wage income sources within the county. This is further attributed to differences in both industry and occupation composition of the region compared to national averages. Menominee County's leisure and hospitality sector has a larger share of administrative than customer service positions, for example. As the character of many of the region's most prominent industry sectors continues to change we should expect this difference to continue to narrow. This, however, may be offset by growth in a number of other income areas, especially related to an aging and retired population. This again suggests that the region should continue to enjoy some measure of economic prosperity in the near future.
